The list of products

We introduce our products according to their applications and their structure.

Fluorinating Agents	7	Trifluoro Aromatic Hydrocarbons	32
Electrophilic Fluorinating Agents	7	1,2,3-Trifluorobenzenes	32
Nucleophilic Fluorinating Agents	7	1,2,4-Trifluorobenzenes	33
Difluoromethylating Agents	8	1,3,5-Trifluorobenzenes	33
Trifluoromethylating Agents	8	Polyfluoro Aromatic Hydrocarbons	34
Trifluoromethylthiolating Agents	9	Tetrafluorobenzenes	34
Other Fluorinated Group Introducing Agents	9	Pentafluorobenzenes	35
Fluorinated Building Blocks	10	Other Polyfluoro Aromatic Hydrocarbons	36
Monofluoro Aromatic Compounds	10	Difluoromethyl / Difluoromethoxy Aromatic Hydrocarbons	37
Monosubstituted (<i>ortho</i> -) Monofluorobenzenes	10	Trifluoromethyl Aromatic Hydrocarbons	37
Monosubstituted (<i>meta</i> -) Monofluorobenzenes	11	Monosubstituted (<i>ortho</i> -) Trifluoromethylbenzenes	37
Monosubstituted (<i>para</i> -) Monofluorobenzenes	12	Monosubstituted (<i>meta</i> -) Trifluoromethylbenzenes	38
Disubstituted (2,3-) Monofluorobenzenes	16	Monosubstituted (<i>para</i> -) Trifluoromethylbenzenes	39
Disubstituted (2,4-) Monofluorobenzenes	17	Disubstituted Trifluoromethylbenzenes	40
Disubstituted (2,5-) Monofluorobenzenes	20	Other Trifluoromethyl Aromatic Hydrocarbons	43
Disubstituted (2,6-) Monofluorobenzenes	23	Trifluoromethoxy Aromatic Hydrocarbons	44
Disubstituted (3,4-) Monofluorobenzenes	23	Trifluoromethylthio Aromatic Hydrocarbons	45
Disubstituted (3,5-) Monofluorobenzenes	26	Pentafluorosulfanyl Aromatic Hydrocarbons	45
Trisubstituted Monofluorobenzenes	26	Fluoro Hetero-monocyclic Compounds	46
Other Monofluoro Aromatic Hydrocarbons	27	Trifluoromethyl Hetero-monocyclic Compounds	48
Difluoro Aromatic Hydrocarbons	27	Fluoro Condensed Heterocyclic Compounds	49
1,2-Difluorobenzenes	27	Trifluoromethyl Condensed Heterocyclic Compounds	50
1,3-Difluorobenzenes	29	Other Fluoro Heterocyclic Compounds	51
1,4-Difluorobenzenes	31	Fluoro Aliphatic Compounds	51

Fluorination Reagents, Fluorinated Building Blocks

The introduction of fluorine into bioactive molecules often results in significant changes in their chemical, physical, and biological properties. Fluorine uniquely affects the property of organic molecules due to the fluorine atom's blocking effect in metabolic transformations and mimicking of enzyme substrates, and then increases the molecular lipophilicity to enhance bioavailability. Approximately 30% of all agrochemicals and 20% of all pharmaceuticals contain fluorine.¹⁾ HMG-CoA reductase inhibitor fluorostatin (atorvastatin), antibiotic fluoroquinolone (levofloxacin), and antitumor fluoronucleoside (tegafur) are successful examples of the introduction of fluorine into organic molecules (Figure 1). Therefore, fluorinating agents are useful tools for the synthesis of pharmaceutical and agricultural compounds.

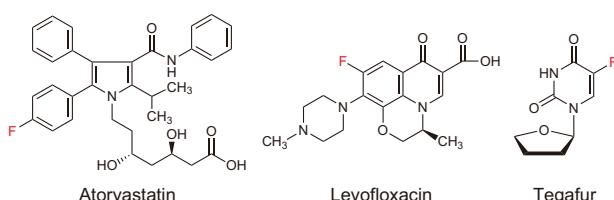

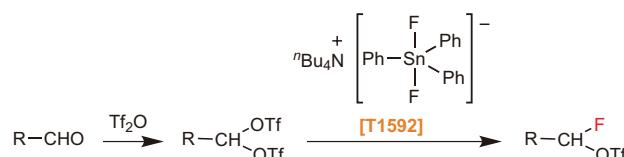

Figure 1. Fluorinated bioactive compounds

Since there are few naturally occurring fluorine containing compounds, it is necessary to fluorinate organic compounds at a certain stage of the syntheses. Though fluorine gas and hydrogen fluoride are used as fluorine sources, they are very toxic and corrosive and require special equipment and techniques for handling them. Therefore, alternate fluorinating agents have been developed, which are used in laboratories to easily introduce a fluorine atom at selected positions of the compounds. The fluorinating agents are roughly classified into two categories: nucleophilic and electrophilic. Nucleophilic fluorinating agents are those where the fluoride anion serves as a reaction active species. Electrophilic fluorinating agents are those where the electron-deficient fluorine atom serves as a reaction active species. In addition, a fluorinated building block is used as a fluorine source, which has both a fluorine atom and a replaceable functional group in a molecule.

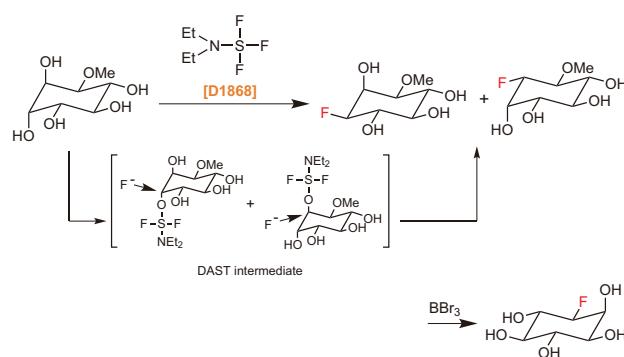

1. Nucleophilic Fluorinating Agents

The most basic nucleophilic fluorinating agent is hydrogen fluoride which is used in large quantity for the industrial production of fluorinated compounds. Hydrogen fluoride, however, is scarcely used in laboratories due to its toxic and corrosive properties and its low reactivity resulting from high H-F bond energy. Nucleophilic fluorinating agents such as KF, CsF [C2204], and Bu₄N·F [T2754] are readily available. These fluorinating agents are hygroscopic, and unfortunately the moisture in these substances forms strong hydrogen bonds with

the fluoride anion and this leads to decrease in reactivity. "Naked" fluoride anions, where the fluoride anion is completely free of hydrogen bonds, have been developed. For example, tetrabutylammonium difluorotriphenylstannate [T1592], which was reported by Gingrasas an alternative reagent to Bu₄N·F, is non hygroscopic with excellent stability to heat and high solubility in organic solvents.²⁾ Martines *et al.* synthesized *gem*-fluorotriflate from aldehyde using [T1592].³⁾

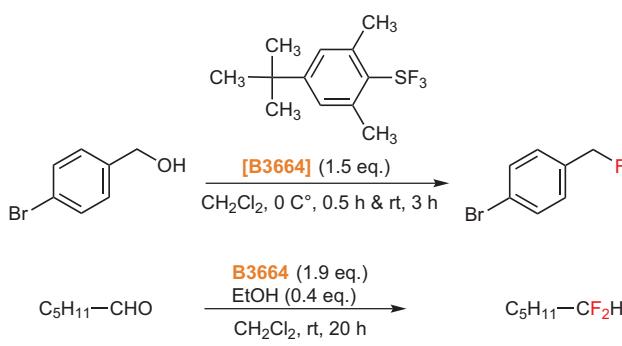

DAST [D1868] is used in a wide variety of synthetic processes for stereospecifically substituting a fluorine atom for a hydroxyl group.⁴⁾ Kozikowski *et al.* have developed the method of producing (-)-fluoro-*myo*-inositol from quebrachitol in two stages.⁵⁾ They reported that in this method, D1868 reacts with either of two axial hydroxyl groups of a quebrachitol to form a DAST intermediate which greatly increases the leaving ability of the hydroxyl group. This enables an easy nucleophilic displacement of the hydroxyl group by the fluoride anion accompanied with steric inversion. D1868 is unstable to heat, and is drastically decomposed by heating. However, in general, the reactions using D1868 are completed in a short time at room temperature or lower temperature.

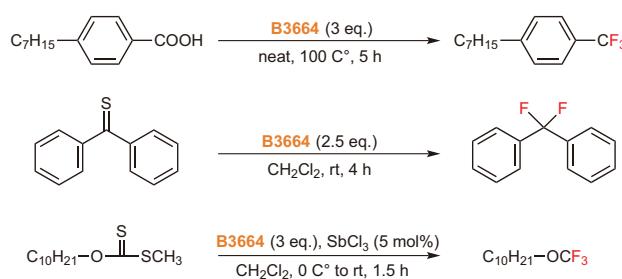

4-*tert*-Butyl-2,6-dimethylphenylsulfur trifluoride (FLUOLEAD™) [B3664], which was first reported by Umemoto, is a novel nucleophilic fluorinating agent.⁷⁾ B3664 is a white crystalline solid with high thermal stability, which has a 232 °C thermal decomposition temperature (by DSC analysis). Differing from other existing fluorinating agents, such as DAST, B3664 has less fuming character. And the reactivity of B3664 to water is slow, which makes it easier to handle in open air.

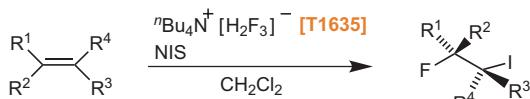

Fluorinations of a hydroxyl or carbonyl group by B3664 afford the corresponding fluorinated compounds in good yields under a wide range of conditions (0 to 100 °C).

Unlike other fluorinating agents, **B3664** can convert carboxyl groups (-COOH) to trifluoromethyl groups (-CF₃) in good yields. Furthermore, thioketones or thioesters can be fluorinated by **B3664**. Thus, **B3664** is a useful fluorinating agent widely applicable to various substrates, and can be an alternative to other fluorinating agents.

Another method for facilitating the attack of fluoride anions is achieved by producing carbocations. Carbocations can be produced by oxidation of organic compounds. Consequently, the combined use of an oxidizing agent and a fluorinating agent enables easy fluorination. In addition, selective fluorination becomes possible by selecting an oxidizing agent. Kuroboshi *et al.* have achieved the synthesis of fluoroiodoalkanes from olefins using tetrabutylammonium dihydrogentrifluoride [**T1635**] and NIS as oxidizing agent.⁸⁾

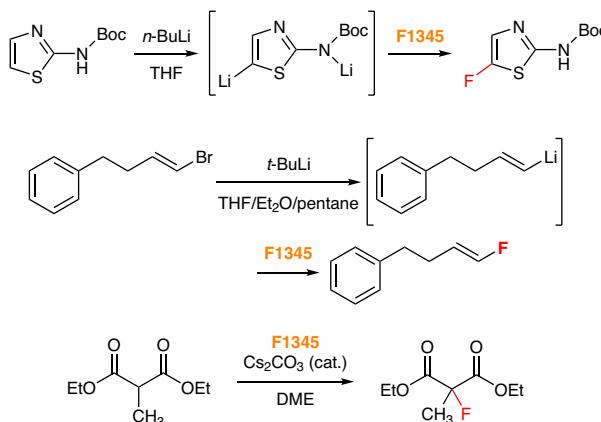

Electrolytic oxidation is also available as a means of oxidation of organic compounds. Purification of the target compound can be done easily by this method because of simple reaction system without use of oxidizing agents.

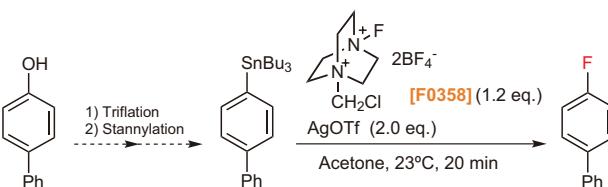

2. Electrophilic Fluorinating Agents

NFBB [**F1345**] is a fluorinating agent sterically protected by a bulky *tert*-butyl group and designed to suppress degradation by strong bases.⁹⁾ The sulfonimide anion generated in the reaction system acts as a deprotonating agent so that the amount of

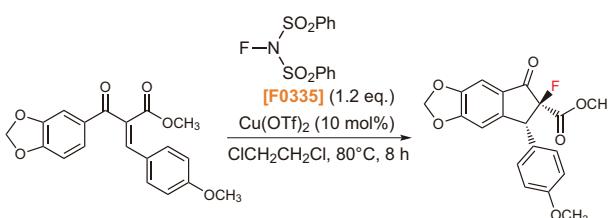

base (cesium carbonate) required to fluorinate active methylene compounds can be reduced to a catalytic amount. **F1345** is a stable and easy-to-handle liquid.

N-Fluoro-*N'*-(chloromethyl)triethylenediamine bis(tetrafluoroborate) [**F0358**] is an easily handled powder and versatile electrophilic fluorinating agent for enols, silyl enol ethers, alkenes, stabilized carbanions, aromatic compounds, organosulfur compounds, Grignard agents, etc.¹⁰⁾

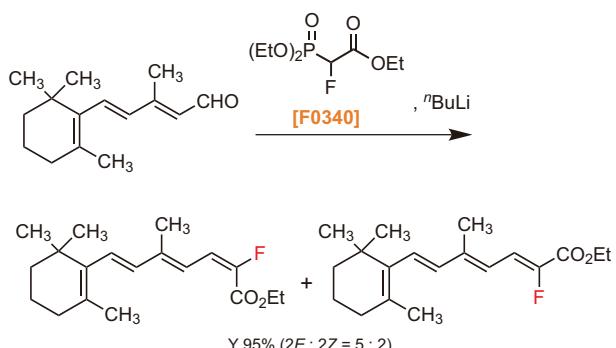

N-Fluorobenzenesulfonimide [**F0335**] is also an easily handled and stable crystalline electrophilic fluorinating agent for enolates, silyl enol ethers, aromatic compounds, organolithium compounds, alkyl phosphate carbanions, etc.¹¹⁾

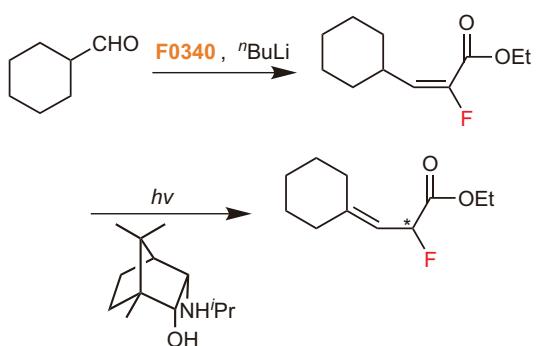

3. Fluorinated Building Blocks

Recently, fluorinated building blocks having both a fluorine atom and substitutable functional group are being used as an easily available fluorine source. In particular, compounds containing a fluorine atom and an electron withdrawing group on the same carbon atom are used as effective fluorinated building blocks to synthesize physiologically active compounds. This type of compound is treated with base to form fluoro-carbanions which react with electrophiles. For example, triethyl 2-fluoro-2-

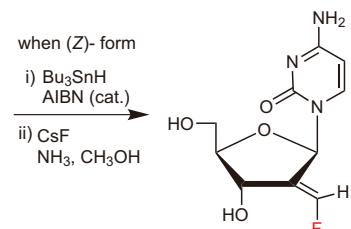

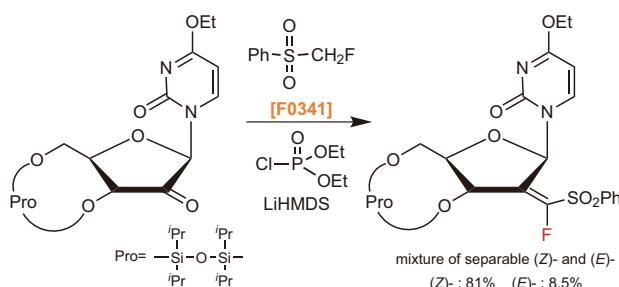

phosphonoacetate [F0340]¹²⁾ produces a fluoro-carbanion in the presence of base. Horner-Emmons reaction of the anions with carbonyl compounds produces α -fluoro- α,β -unsaturated esters. These esters can be reduced into aldehydes and alcohols, and are very useful intermediates to many physiologically active compounds. Synthetic compounds such as vitamin A derivatives,¹³⁾ insect sex pheromones,¹⁴⁾ and pyrethroid¹⁵⁾ with insecticidal action are major examples of fluorinated physiologically-active compounds produced with F0340.

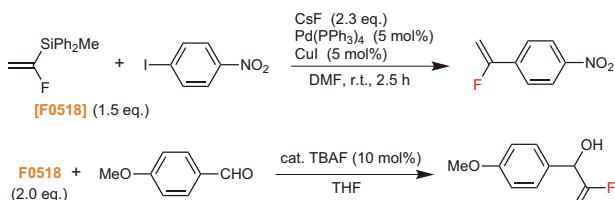

Piva observed that α -fluoro- α,β -unsaturated esters can be converted into α -fluoro- β,γ -unsaturated esters in the presence of base by irradiation with 254 nm light. If an optically active amine is used as a base, either of the optical antipodes can be preferentially obtained.¹⁶⁾

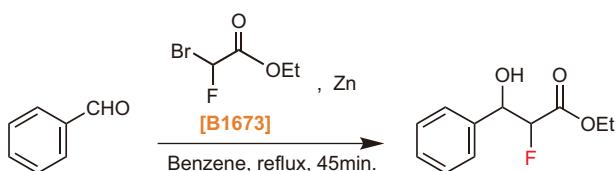

Fluoromethyl phenyl sulfone [F0341], having both a fluorine atom and a sulfonyl group on the same carbon atom, produces fluoro-carbanions in the presence of base.¹⁷⁾ These anions react with carbonyl compounds to form α -fluoro- β -hydroxyphenyl sulfone derivatives. This sulfone can be converted into α -fluoro- α,β -unsaturated sulfone and fluoro-vinyl derivatives. McCarthy *et al.* reported the method of stereoselectively introducing fluoromethylene units into a nucleoside using F0341.¹⁸⁾

1-Fluorovinylsilane [F0518] reacts with aryl halides in the presence of fluoro anion and a catalytic amount of CuI, Pd catalysts to afford the corresponding (1-fluorovinyl)arenes.¹⁹⁾ This reaction proceeds *via* transmetalation of the 1-fluorovinyl group under mild conditions and affords the reaction products in high yields. In addition, F0518 reacts with aldehydes to give the corresponding monofluoroaryl alcohols in good yields.²⁰⁾

Ethyl bromofluoroacetate [B1673], having a fluorine atom, a bromine atom, and a carboxyl group on the same carbon atom, reacts with zinc to form Reformatsky reagent. This Reformatsky reagent reacts with carbonyl compounds to form α -fluoro- β -hydroxy esters,²¹⁾ and reacts with *N*-(α -aminoalkyl)benzotriazoles to form α -fluoro- β -amino esters.²²⁾ Takeuchi *et al.* synthesized an *N*-protected α -fluoro- α -amino ester using B1673, and reported the details of its chemical properties.²³⁾

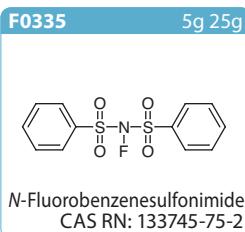

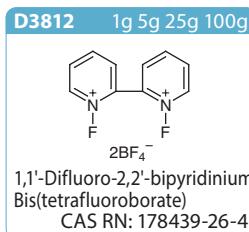

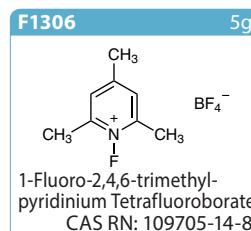

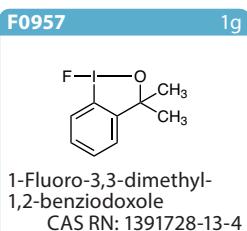

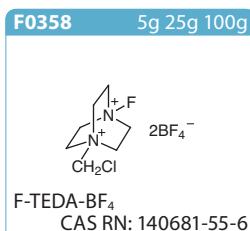

The fluorination reagents and fluorinated building blocks described here require only normal methods of organic synthesis. Special equipment and techniques are not necessary to produce fluorinated organic compounds. These fluorination reagents and fluorinated building blocks have already been successfully used to produce a number of medicinal and agricultural chemicals.

E0772  Ethyl 4,4,4-Trifluorocrotonate CAS RN: 25597-16-4	E0830  Ethyl 4,4,4-Trifluorobutyrate CAS RN: 371-26-6	E1018  Ethyl 4,4-Difluoroacetoacetate CAS RN: 352-24-9	E1019  Ethyl 1,1,2,2-Tetrafluoroethyl Ether CAS RN: 512-51-6	E1020  Ethyl 1,1,2,3,3,3-Hexafluoropropyl Ether CAS RN: 380-34-7
E1022  Ethyl 5 <i>H</i> -Octafluorovalerate CAS RN: 2795-50-8	E1087  Ethyl 3-Ethoxy-2-(2,2,2-trifluoroacetyl)acrylate CAS RN: 571-55-1	F0030  Ethyl Fluoroacetate CAS RN: 459-72-3	F0183  Methyl Fluoroacetate CAS RN: 453-18-9	F0185  2-Fluoro-β-alanine Hydrochloride CAS RN: 867-84-5
F0215  Butyl Fluoroacetate CAS RN: 371-49-3	F0283  Diethyl Fluoromalonate CAS RN: 685-88-1	F0500  2,2-Difluoro-2-(fluorosulfonyl)-acetic Acid CAS RN: 1717-59-5	F0511  1-Fluoroadamantane CAS RN: 768-92-3	F0587  Fluorocyclohexane CAS RN: 372-46-3
F0631  2-Fluorocyclohexanol CAS RN: 656-60-0	F0665  Fluoroacetonitrile CAS RN: 503-20-8	H0024  Heptafluorobutyric Acid CAS RN: 375-22-4	H0424  1,1,1,3,3,3-Hexafluoro-2-propanol CAS RN: 920-66-1	H0425  Hexafluoroacetone Hydrate CAS RN: 34202-69-2
H0476  Hexafluoroacetylacetone CAS RN: 1522-22-1	H0548  1 <i>H</i> ,1 <i>H</i> -Heptafluoro-1-butanol CAS RN: 375-01-9	H0594  Ethyl Heptafluorobutyrate CAS RN: 356-27-4	H0596  Heptafluoropropyl Iodide CAS RN: 754-34-7	H0629  Heptafluoroisopropyl Iodide CAS RN: 677-69-0
H0649  2,2,3,4,4-Hexafluoro-1-butanol CAS RN: 382-31-0	H0658  Hexafluoroglutaric Acid CAS RN: 376-73-8	H0689  Heptafluoropropyl Bromide CAS RN: 422-85-5	H0744  Diethyl Hexafluoroglutarate CAS RN: 424-40-8	H0843  Heptadecafluoronanoic Acid CAS RN: 375-95-1

Fluorination Reagents, Fluorinated Building Blocks
